

THE TRUE COST OF OWNERSHIP AGENT

Meridian

The price tag is the least honest number in the room.

Buyer's advocate intelligence, run locally · May 31, 2026

— THE STAKES

+45%

Toronto mortgage arrears, year over year. Behind every figure is a family that bought on the list price.

1.1

Canadian mortgage rates — at rates we originally signed

The default cascade starts at step one: a buyer signs based on a number, never the real cost.

— THE WRONG QUESTION

EVERY TOOL
ASKS

"Can you afford the monthly payment?"

MERIDIAN ASKS

"Can you survive owning this for ten years with interest rate shocks, hidden assessments and delays without defaulting?"

The list price hides a decade of cost. Meridian makes that decade visible before the offer

— HOW IT WORKS

A four-agent reasoning pipeline.

Agent 01

Intake & Planning

Geocodes the address, classifies the property, and decides which sources to query.

LLAMA 3.1 8B

Agent 02

Retrieval

Parallel async fan-out to city data. Point-in-polygon spatial joins. No model in the loop.

DETERMINISTIC

Agent 03

Analysis & Cost

All dollar math: land tax, tax projection scenarios. The model touches money.

DETERMINISTIC

Clean JSON contracts at every boundary — each agent upgrades independently.

— THE NVIDIA STACK

It runs entirely on the DGX Spark.

- **Local inference via NVIDIA NIM.** Llama 3.1 8B served on an OpenAI-compatible endpoint — no cloud round-trip.
- **Private by design.** A buyer's address and finances never leave the device. The whole pipeline is on-box.
- **Headroom to scale.** A config toggle swaps in a larger NIM model when the moment calls for more reasoning.
